CHALLENGE SHEET

Snapsync

A staff photo tool where a forged token and a hidden internal route reach the flag.

DIFFICULTY	TRACK	HOST PORT	LAB ID
MEDIUM	WEB	3000	snapsync

EASY | **MEDIUM** | HARD | INSANE

VERIFY THE SOLVE

```
python3 ../scripts/check.py snapsync
```

Brief

SnapSync is a small internal tool staff use to upload and share work photos. Every employee gets an account, can upload photos, and can pull back the ones they own. One route in the app sits outside the normal employee reach.

Setup

Run this from the lab directory:

```
docker compose up -d --build
```

Open `http://localhost:3000`. Give it a few seconds after startup, then confirm it is ready:

```
curl http://localhost:3000/api/health
```

To return to a clean state:

```
./reset.sh
```

Goal

Starting from a normal account, reach the restricted route and extract its flag. Verify the solve from the lab directory:

```
python3 ../../../scripts/check.py .
```
