EASY | MEDIUM | HARD | INSANE

VERIFY THE SOLVE

```
python3 ../scripts/check.py duckbot
```

Brief

DuckBot is a lightweight customer-support chatbot running in an isolated CTF environment. The assistant has internal instructions containing a secret flag. The application is intentionally vulnerable to prompt injection, allowing a user to manipulate the assistant into disclosing information that should remain private.

Setup

Build and start the challenge:

```
docker compose up --build
```

The challenge is available at:

```
http://localhost:8080
```

Goal

Interact with DuckBot and obtain the hidden flag through prompt injection.

Scope

This challenge is self-contained and does not require an external LLM, API key, database, or Internet access.

Intended Technique

Prompt Injection / System Prompt Leakage.

Evidence

A successful submission should include: - The request/prompt used to manipulate DuckBot. - The relevant chatbot response containing the flag. - A concise explanation of why the secret was exposed.
